```
This invention, in the area of plant biotechnology, relates to novel polynucleotides comprising a nuclectide sequence encoding a protein which is involved in or associated with the synthesis, metabolism or described in or associated with the synthesis, metabolism or carbobydrates in the plant grain and the expression of which is up-regulated during grain filling. The plant is selected from corn, tomato, banana, canola, cotton, peanut, sorghum, tobacco, sugarbeet, wheat, and rice. The invention may be useful for the improvement of protein, oil, starch, fibre and moisture content of the cereal grains. In addition, carbohydrate levels may be modified to a more desirable level using the present invention. The present sequence is the sequence of a rice protein of the invention. Note: The sequence data for this patent did not form part of the printed appecification, but was obtained in electronic format directly from WIPO at tp. wipo.int/pub/publishedpct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New plant genes encoding polypeptides having an activity involved in or associated with the synthesis, metabolism or degradation of carbohydrates in the plant grain useful in generating plants having improved nutritional properties.
tomato; banana; canola; cotton; peanut; sorghum; tobacco; sugarbeet; wheat; rice; protein; oil; starch; fibre; moisture content; cereal grain; gene; ds; plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 15; SEQ ID NO 238; 130pp; English:

Gaps

```
Candida tropicalis transformation system - using host auxotrophic in an amino acid, purine or pyrimidine pathway as result of mutagenesis.
                                                                                                                                                                                                                                                                                                                                                                      The gene product (and opt. the URA3 B gene product - AAR06640) is used to complement an auxotrophic host to prototrophy. The host may be defective in orotidine-5'-phosphate decarboxylase activity. See also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to CDNA clones obtained by an oligo-capping method, where none of these clones are identical to any known human mNNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as artibodises, antisense molecules and siRNAs that can all be used to bind to and modulate expression of the ODNA molecules. As such, these can enseful for diagnostic markers or therapeutic targets for molecules are useful for diagnostic markers or therapeutic targets for molecules are useful for diagnostic markers or therapeutic targets for the various disease or morbid states. In particular, they are useful in gene therapy for treating ostcoporosis, neurological disease, Alzheimer's disease, Parkinson's disease, dementia, short memory and various cancers, as well as for maintening equilibrium of sense or motor function, and for traating emotional reaction, fear response and panic. Accordingly, they exhibit ostcopathic, neuroprotective, noctropic, antiparkinsonian, cytostatic and tranquiliser activities. This polypeptide is a protein cencoded by a full length human cDNA sequence of the invention. NOTE: This sequence is not given in the sequence listing of the specification but and the contained on CD-ROM from the European Patent Office, Vienna Sub-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                      New 1995 cDNA, useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers.

```
The invention relates to 12 novel genomic DNA sequences and proteins which are components of the omega hydroxylase complex of Candida tropicalis ATCC 20366. The DNA sequences (AAA3066-A30577) respectively encode cytochrome P450 NADPH oxidoreductases CPRA and CPRB (AAY90596, AAY90597) and cytochrome P450 monoxygenases CPRSAAA, CYPSAABA, CABABB, CAGABB, CA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CPRA; CPRB; CYP52A1A; CYP52A2A; CYP52A2B; CYP52A3A; CYP52A3B; CYP52A5A; CYP52A5B; CYP52A5B; CYP52A5B; CYP52A6B; CYP52D4A; URA3A; cytochrome P450; NADPH2 reductase; omega-hydroxylase complex; dicarboxylic acid; enzyme.

The invention relates to an isolated nucleic acid selected encoding Candida tropicalis omega oxygenase complex enzymes (CPR) designanced PPSO monooxygenase (CYP) and NADPH reductase enzymes (CPR) designated CPRA, CPP52A1A, CYP52A2B, CYP52A3A, CYP52A3B, CYP52A3B, CYP52A3B, CYP52A3B, CYP52A3B, CYP52A3B, CYP52A3B, CYP52AB, CYP52ABB or CYP52D4A) or their coding regions. Also included are the CPR/CYP proteins, a vector comprising the nucleic acid cited above, a host cell transfected or transformed with the above nucleic acid, producing the proteins, discriminating members of a gene candidate and production of the production of a dicarboxylic acid and increasing the production of the proteins cited above. The host cell is C. tropicalis is specifically that may be utilised as industrial intermediates in the manufacture of diesters and polymers (e.g. as thermoplastics, plasticishing agents, lubricants, hydraulic fluids, agricultural chemicals, pharmaceuticals, carrying a CYP or CPR gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gene; enzyme; yeast; omega oxygenase complex; cytochrome P450 monooxygenase; CYP; NADPH reductase enzymes; CPR; CPRA;
                                                                                                                                                                                                                                                                                                                                                   New nucleic acid encoding cytochrome P450 and NADPH reductase enzymes (e.g. CPRA, CPRB or CYP52A1A), useful for producing dicarboxylic acids that may be utilized as industrial intermediates in manufacturing
                                                                                                                                                                                                                                                               Madduri KM, Cornett CA;

                                                                                                                                                                                                                                                                                                                                                                       CYP52A2B; cytochrome P450; NADH reductase; dicarboxylic acid production; organic substrate oxidation; fatty acid oxidation; gene integration vector; CYP; CPR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acids encoding a CYP52A2B protein useful for increasing the production of dicarboxylic acid for oxidizing organic substrates such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes an isolated nucleic acid encoding a CYP52A2B protein comprising the fully defined sequence of 522 amino acids, as given in the specification, and comprising a coding region defined by nucleotides 1072-2640 of a fully defined sequence of 3755 base pairs, given in the specification. The nucleic acids encoding the cytochrome P450 and NADH reductase enzymes of Candida tropicalis are useful for increasing the production of dicarboxylic acid for oxidising organic substrates such as fatty acids. This sequence represents a Candida tropicalis associated polypeptide.

```
The invention relates to a new isolated nucleic acid which encodes a CPRA, CPRB, CYP52A1A, CYP52A2A, CYP52A3B, CYP52A3B, CYP52ABA, CYP52ABB, CYP52ABB, CYP52ABB, CYP52ABB, CYP52ABB or CYP52D4A protein. The nucleic acid is useful for discriminating between members of a gene family by quantifying the amount of mRNA in a sample. The present sequence represents the amino acid sequence of a Candida tropicalis protein.
                                                                      CPRA; CPRB; CYP52A1A; CYP52A2A; CYP52A2B; CYP52A3A; CYP52A3B; CYP52A5A;
CYP52A5B; CYP52A8A; CYP52A8B; CYP52D4A; gene family; URA3A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New CPRA, CPRB, CYP52A1A, CYP52A2A, CYP52A2B, CYP52A3A, CYP52A3B, CYP52A5A, CYP52A5B, CYP52A6B or CYP52D4A gene, useful for discriminating members of a gene family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a new isolated nucleic acid which encodes a CPRA, CPRB, CPBSAA, CYPS2ASA, CYPS2ASB, CYPS2ASB, CYPS2ASB, CYPS2ASB, CYPS2ASB, CYPS2ASB, CYPS2ASB, CYPS2ASB, CYPS2ASB or CYPS2DAB protein. The nucleic acid is useful for discriminating between members of a gene family by quantifying the amount of mRNA in a sample. The present sequence represents the amino acid sequence of a Candida tropicalis protein.

The present sequence is that of the polypeptide encoded by the URA3A selectable marker gene of Candida tropicalis. A claimed C. tropicalis cell has a disrupted chromosomal POX4 and/or POX5 gene in which a portion of the gene(s) is deleted through homologous recombination with a selectable marker gene, especially URA3. This blocks the beta-oxidation pathway of the cell. The size of the delection of the chromosomal gene prevents the strain from reverting to wild-type activity. The cell is used in a claimed process for producing alpha,omega-dicarboxylic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New non-revertible beta-oxidation blocked Candida tropicalis cell having a disrupted chromosomal POX4 and/or POX5 gene(s), useful for producing dicarboxylic acids used in the preparation of perfumes or macrolid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CYP; CPRA protein; CPRB protein; dicarboxylic acid; plastic; adhesive;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated CPRA, CPRB, CYP52A1A, CYP52A2A, CYP52A2B, CYP52A2B, CYP52A2B, CYP52A2B, CYP52A2B, CYP52A2B, CYP52A2B, CYP52A2B, CYP52A2B, CYP52A4 protein (CYP - cytochrome P450, CPR - NADPH reductase) of the Candida tropicalis omega-hydroxylase complex. Also included are the nucleoic aids encoding the CYP/CPR proteins (including their coding regions), a vector comprising the nucleotide acid, a host cell transfected or transformed with the vector, discriminating members of a gene family by quantifying the amount of target mRNA in a sample and increasing production of a dicarboxylic acid (comprising the host cell having a naturally occurring CPR/CYP protein and culturing the host cell having a naturally occurring of dicarboxylic acid. The CYP and CPR proteins present in higher levels than normal is useful for increasing production of dicarboxylic acids. The present sequence represents a C. tropicalis URA3 protein, used to make the CYP/CPR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

PRESENTATION OF STREET OF

```
The invention relates to antisense inhibitors of genes essential to prokaryotic callular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,
                                                                                   Candida tropicalis transformation system - using host auxotrophic in an amino acid, purine or pyrimidine pathway as result of mutagenesis.
                                                                                                                                                                 The gene product (and opt. the URA3 A gene product - AAR06639) is used to complement an auxotrophic host to prototrophy. The host may be defective in orotidine-5'-phosphate decarboxylase activity. See also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises CYP genes from Candida tropicalis which encode CPRA and CPRB proteins. The invention is useful for CPRA and CPRB protein production, the DNA and protein sequences are useful for increasing production of dicarboxylic acid in chemical products, such as: plastics, adhesives and fragrances. The present amino acid sequence represents a Candida tropicalis URA3A protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid encoding a CPRA protein, used to increase production of dicarboxylic acid, for use in chemical products including plastics, adhesives, and fragrances.

            useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a rokavoric of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell contraining the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding
Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also

the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway contained for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for proliferation to isolate candidate molecules for rational card drug discovery programs, or for screening homologous nucleic acids credured for proliferation in cells other than S. aureus, S. typhimurium, CC the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained for the interction of the printed specification, but was obtained for the printed specification, but was obtained for the printed format farectly from MIPO at

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chomosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sequence tags for identifying expressed activity of (II) as useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in diagnostics for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic mino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from MIPO at (II) and (II) acquences

The cDNA clones are isolated from various tissue types, and may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate protein expression. The polypeptides and nucleic acids may be used as nutrients or to modulate cytokine and cell proliferation/differentiation activity and may also be involved in modulation of the immune system. The cDNA sequences, proteins, their agonists and/or antagonists exhibit haematopoiesis regulating activity, tissue growth activity; activin/inhibin activity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    е.

                                                             invention. The DNA was isolated from a human adult testis cDNA library, and is designated clone CK2011. The DNA sequences and encoded polypeptides can be used as nutritional sources or supplements, or may exhibit e.g. cytokine and cell proliferation/differantiation activity, immune stimulating or suppressing activity, haematopoiesis regulating activity, receptor/ligand activity, anti-inflammatory activity, cativity, chemostatic/chemokinetic activity, cathorises activity, tuned activity, tissue growth activity, tumour inhibition activity or other activities
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; secreted protein; nutrient; cytokine modulator; proliferation;

organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed, (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational for displaying proteins or screening for homologous nucleic acids required for cellular proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence date for this part of form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:
(a) an oligo-dT primer and an oligonucleotide complementary to the
complementary strand of a polynucleotide which comprises one of the 5602
nucleotide sequences defined in the specification, where the

of an oligonucle conference of a polynuclectide which comprises a 5-end complementary strand of a polynuclectide which comprises a 5-end sequence and an oligonuclectide comprising a sequence complementary to the camprise and an oligonuclectide comprises a 3'-end sequence, where the polynuclectide which comprises a 1'-end sequence, where the oligonuclectide which comprises a 1'-end sequence, where the combination of the 5'-end sequence, 3'-end sequence is selected from those defined in the specification. The primers are useful for synthesising polynuclectides, particularly full-length cDNAs. The primers are also useful for the cetection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the countries and the full-length cDNAs are also useful for the countries and any without any specialised methods. Ad403166 to AAH13628 and AAH13633 to AAH13612 represent human amino acid sequences; and AAH13629 to AAH13622 represent coligonucleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
oligonucleotide comprises at least 15 nucleotides; or (b) a combination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

(AJIN) AJINOMOTO

WPI; 2004-127093/13. N-PSDB; ADL90004 Novel protein having transaldolase activity or glucose-6-phosphate isomerase activity, useful for producing a target substance e.g., xylitol.

Claim 1; SEQ ID NO 18; 89pp; Japanese.

The invention comprises the amino acid and coding sequences of dluconobacter oxydans proteins which possess transationaes activity and/or glucose-6-phosphate isomerase activity. The DNA and protein sequences of the invention are involved in the production of NADH. The DNA and protein sequences of the invention are useful for manufacturing a target substance. The present amino acid sequence represents the Gluconobacter oxydans glucose-6-phosphoric acid isomerase protein.

Sequence 957 AA;

```
The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
cnocding a polypeptide whose expression is inhibited by the antisense
nucleic acid; (2) a host cell containing the vector; (3) an isolated
continued or its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide or its fragment whose expression is inhibited by the
cartisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
confictation, (7) identifying a gene in an operon required for
crequired for proliferation, or that inhibits cellular proliferation, (8)
identifying a gene required for cellular proliferation or the biological
capathway in which a proliferation-required gene or its gene product lies
corresponded to the test compound that inhibits profiling a
compound's activity, (11) a culture comprising strains in which the gene
compound's activity, (11) a culture comprising strains in which the gene
compound's activity, (11) a culture comprising strains in which the gene
crowpound's activity, (11) a culture comprising strains in which the gene
crowpound's activity, (11) a culture comprising strains in which the gene
crowpound's activity, (11) a culture comprising strains in which the gene
crowpound's activity, (11) a culture comprised
compound's activity, (11) a culture comprised
compound's activity, (12) dentifying the target of a compound that inhibits the
crowpound's are useful for
confidentifying proteins or screening for homologous nucleic acids are useful for
identifying proteins or screening for homologous nucleic acids are sequired
                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense, prokaryotic essential gene, cell proliferation, drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Zyskind JW;

               drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at from the published_pot_sequences

                                                                                                                                                                                                                                                   8
```

The invention relates to novel human nucleic acid-associated proteins and genes encoding them, sequences that have at least 90-99 % identity to the sequences; or biologically active or immunogenic fragments of these. The polypeptides and polymucleotides are useful in diagnosing, treating and preventing disorders associated with aberrant expression of NAAP, such as

ö
cell proliferative (e.g. cancer or atherosclerosis), neurological (e.g. stroke, Parkinson's disease or epilepsy), developmental (e.g. Cushing's syndrome), autoimmune/inflammatory (e.g. AIDS or allergies), or infections. These may also be used as elements on a microarray which may monitor or measure protein-protein interactions, drug-target interactions, and gene expression profiles. The polynucleotide may also be used in chromosomal mapping and in various diagnostic assays. These are also useful in assessing the effects of exogenous compounds on the expression of mucleic acids and amino acid sequences of NAAP, in facilitating discovery process, and in investigating the pathogenesis of diseases or medical conditions. This sequence corresponds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic, antirheumatic, antiarthritic, antidiabetic, ophthalmological, antipsoriatic, antiarteriosclerotic, cardiant; vasotropic; angiogenesis; gene therapy; vasculature; cancer; rheumatoid arthritis; psoriasis; diabetic retinopathy; cardiovascular disease; atherosclerosis; ischemic limb disease; coronary artery disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the isolation of novel genes (ACF3446-ACF34559) encoding proteins (ABR6410-ABR64281) involved in the process of angiogenesis. The nucleic acid molecules are useful in identifying and/or obtaining full-length human genes involved in an angiogenic process. The
                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     e.g.

for expression of a polynucleotide encoding a polypeptide from a

microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant

batching an improved property comprises transforming a plant with the recombinant DNA construct and growing the transforming a plant with the recombinant DNA construct is useful for improving plant, where the polynucleotide or polypeptide is useful for improving plant properties.

The recombinant DNA construct is useful for improving plant with improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or persts, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved lignin production or improved algant growth and development under at least one stress condition, improved lignin production or improved algant growth and development condition in providing in production or improved galactomannan condition, improved lignin production in improved algant growth was earlied polypeptide used in the cope of the invention. Note: The sequence date for this patent did not form part of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic

concleic acid molecule, polypeptides or complexes encoded, cells or genetically modified non-human animals derived from these are useful for the screening of candidate plaramaceutical compounds used in treating angiogenesis-related disorders. They are also useful for diagnosing, prognosticating or treating an angiogenesis-related disorder, which involves uncontrolled or enhanced angiogenesis or is a disorder; which involves uncontrolled or enhanced angiogenesis or is a disorder in which a decreased vasculature is of benefit (e.g. cancer, rheumatoid arthritis, atherosclerosis), or involves inappropriately arrested or decreased angiogenesis or involves inappropriately arrested or decreased angiogenesis or involves inappropriately arrested or decreased angiogenesis or is a disorder in which an expanding vasculature is of benefit (e.g. ischemic limb disease or coronary artery disease). The modulator of expression or activity of the polypeptide encoded by the treatment of an angiogenesis-related disorder. This sequence corresponds to one of the novel angiogenic protein
                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; berbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomanna; bacterial polypeptide.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to

SEQ ID NO 6737; 122pp; English.

```
The invention relates to an inhibitor of catalytically active memapsin 2 (an aspartic protease which can cleave at beta secretase sites), which binds to the active site of memapsin 2 defined by the presence of two catalytic aspartic residues and substrate binding cleft. Also included is memapsin 2 sub-sites comprising: (a) reacting a mixture of memapsin 2 unbertase comprising: (a) reacting a mixture of memapsin 2 unbertases comprising: (a) reacting mixture of memapsin 2 substrates; or (b) preparing a combinatorial intervier of memapsin 2 substrates; or (b) preparing a combinatorial clibrary of memapsin 2 inhibitors containing a base sequence taken from OM99-2 (Glu-val-Asn-Leu-Ala-Ala-Glu-phe), probing the library of inhibitors with memapsin 2 which binds to several inhibitors to generate several bound memapsin 2, and detecting the bound memapsin 2 with an antibody raised to memapsin 2 and detecting the bound memapsin 2 with an antibody raised to memapsin 2 and an alkaline phosphatase conjugated secondary antibody. The inhibitors may be used in the manufacture of a medicament for the treatment of Alzheimer's disease since memapsin 2 may be involved in the cleavage of amyloid precursor protein (APP), and for the companiant preference in memapsin 2 sub-sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     memapsin 2 activity inhibitor useful in treatment of e.g. Alzheimer's

```
catalytic appartic residues and substrate binding cleft. Also included is a method of determination of the substrate side-chain preference in semapsin 2 sub-sites comprising; (a) reacting a mixture of memapsin 2 substrates with memapsin 2, and determining the sub-site preference of memapsin 2 by determining relative initial hydrolysis rates of the mixture of memapsin 2 substrates; or (b) preparing a combinatorial library of memapsin 2 inhibitors containing a base sequence taken from 0M99-2 (Glu-Val-Asn-Leu-Ala-Ala-Glu-phe), probing the library of inhibitors with memapsin 2 and addetecting the bound memapsin 2 with an antibody raised to mempsin 2 and an alkaline phosphatase conjugated secondary antibody. The inhibitors may be used in the manufacture of a medicament for the treatment of Alzheimer's disease since memapsin 2 may be involved in the cleavage of amyloid precursor protein (APP), and for determining the substrate side-chain preference in memapsin 2 sub-sites.

The present sequence represents a subsite variant peptide used to
                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an inhibitor of catalytically active memapsin 2 dan aspartic protease which can cleave at beta secretase sites), which binds to the active site of memapsin 2 defined by the presence of two catalytic aspartic residues and substrate binding cleft. Also included is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New memapsin 2 activity inhibitor useful in treatment of e.g. Alzheimer's

```
memapsin 2 sub-sites comprising: (a) reacting a mixture of memapsin 2 substrates with memapsin 2, and determining the sub-site preference of memapsin 2 by determining relative initial hydrolysis rates of the mixture of memapsin 2 substrates; or (b) preparing a combinatorial library of memapsin 2 inhibitors containing a base sequence taken from (oM99-2 (Glu-Val-Asn-Leu-Ala-Ala-Glu-phe), probing the library of inhibitors with memapsin 2 which binds to several inhibitors to generate several bound memapsin 2, and detecting the bound memapsin 2 with an antibody raised to memapsin 2 and an alkaline phosphatase conjugated secondary antibody. The inhibitors may be used in the manufacture of a medicament for the treatment of Alzheimer's disease since memapsin 2 may be involved in the cleavage of amyloid precursor protein (App), and for determining the substrate side-chain preference in memapsin 2 sub-sites.

The present sequence represents a subsite variant peptide used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò

```

Efficiency of expression of lipoprotein expression vectors is improved by introducing the omp A signal peptide from E.coli in place of lipoprotein signal sequence. A fusion protein is produced where the desired protein carries the omp A signal peptide at its N-terminal end. This signal

```
The invention relates to annotating a query sequence involving accessing patterns associated with a database comprising annotated sequences, assigning attributes to the patterns based on the annotated sequence assigning attributes to the patterns based on the annotated sequence and using the patterns with assigned attributes to analyse the query sequence. Also included are an apparatus for annotating a query sequence. The method further comprises the step of selecting the accessed patterns that match the query sequence, storing the patterns with assigned attributes, the attribute vector from the patterns with assigned attributes, the attribute vector faracterising portions of the query sequence is a polypeptide sequence comprising amino actific residues and the attribute vector comprises a number of counters (the number of counters is proportional to the number of amino actifications of the query sequence). The assigned attributes are used to contribute values to counters of the attribute vector corresponding to portions of the query sequence matched by the patterns. The method also comprises a plurality of attribute vectors where the plurality of
                                                                                                                                                                                                                                                               ö
          is then cleaved off. No modification of the cleavage site is necessary during the secretion process, unlike for the lipoprotein signal peptide. Synthetic linkers were inserted to ensure the structural gene was in phase with the signal sequence. Proteins encoded by plasmids omp A-1 and comp A-3 demonstrate the other two reading frames. (AAN80124 and AAN80126). See also AAN80118-9 and AAN80128. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Annotating a query sequence e.g. protein sequence involves accessing patterns associated with a database comprising annotated sequences, assigning attributes to the patterns based on the annotated sequence and analyzing the query sequence.

attribute vectors are ranked, and the top ranking attribute vectors are reported. The method comprises the step of determining a score for the patterns with assigned attributes used to contribute to the attribute vector. The score represents a degree of similarity between the query sequence and the annotated sequences of the database and the score is normalised. The attributes relate to at least one of secondary structure characteristics of the query, presence of known domains, signal peptides, active sites, post-translationally modified sites, cytoplasmic behaviour, extracellular behaviour, and similarity of the query to each of the three phylogenetic domains as a function of amino acid position. The method is used for analysing or annotating query sequence e.g. protein or amino acid sequence, for elucidating properties of protein (including functional, structural and physiochemical properties) directly from corresponding amino acid sequence and for forming a bio-dictionary. The method is also useful for determining cytoplasmic, transmembrane or extracellular region of a query sequence and allows automated elucidation for annotating query sequence and allows automated elucidation for annotating query sequences or complete genomes, quickly, exhaustively previously. The present sequence is a peromen unsiquitin, analysed using the method of the invention.

DNA or DNA libraries produced this way are used to produce modular polypeptides, particularly enzymes, which can be used to act on substrates to produce compounds for therapeutic testing. Enzymes of particular interest are those involved in non-ribosomal peptide synthesis or polyketide synthesis, and compounds for testing are particularly macrolide antibiotics, including penicillins, vancomycins or erythromycins, but may also be modular receptors. The present sequence is a peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Preparing DNA encoding modular protein for e.g. producing new enzymes for synthesis of polyketide antibiotics, comprises cyclic integration of fragments into a vector.
                                                                                                                                                                                                                                                                                                                                                                               Modular enzyme system; cyclic gene synthesis; repetitive coding sequence; antibiotic; non-ribosomal peptide synthetase; NRPS; PKS; polyketide synthase; actinomycin biosynthase.

The invention relates to an isolated polynucleotide encoding a polypeptide with biological activity. The polynucleotides and polypeptides are useful in diagnostics, forenaics, gene mapping, identification of mutations responsible for genetic disorders and other traits, to assess biodiversity, as nutritional sources or supplements. The polynucleotides may also be used as molecular weight markers, chromosome markers or map related gene positions, or as an antigen to raise anti-DNA antibodies or elicit immune response. The polypeptides are useful for raising antibodies, as markers for tissues in which the corresponding polypeptide is expressed, for re-engineering damaged or diseased tissues, for treating myeloid or lymphoid cell disorders, in bone cartilage, tendon, ligament and/or nerve tissue growth or regeneration, in wound healing, in tissue repair and replacement, in healing of burns, incisions and ulcers, and in treating cancer. The present sequence represents the amino acid sequence of a novel human
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotides and secreted proteins, useful for treating myeloid or lymphoid cell disorders, in bone cartilage, tendon, ligament and nerve tissue growth or regeneration, in wound healing, and in tissue repair and replacement.

```
This sequence represents a fragment of a secreted human protein encoded by the nucleic acid molecule detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAX79002) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 53 novel genes and their fragments (nucleic acid sequences: AAX79011-X79064; amino acid sequences AAY1411-Y14464) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 53 polynucleotides, based on which tissues they are most highly expressed in (see AAX79011 for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó

Florence KA, Gree Sbner R, Olsen H;

Ebner R,

This invention relates to novel polynucleotides encoding human secreted proteins. Specifically, it refers to the vectors, host cells, recombinant and synthetic methods for producing human polynucleotides, polypeptides and antibodies. Furthermore, it relates to screening methods to identify agonists and antegonists that can be used to inhibit or enhance the production and function of the secreted proteins. The present invention describes these compositions as useful for diagnosing, treating or

                                                                                                                                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                       ö
                          The present sequence is that of a human 22P4F11 polypeptides, as deduced from an isolated partial CDNA (see AAZ94894). The full-length 22P4F11 sequence is provided in AAY79489. 22P4F11 is a testis-specific gene in normal tissues, and is also expressed in human prostate tumours, in some cases at high levels. The 22P4F11 transcript and/or protein may represent a useful diagnostic marker and/or therapeutic target for prostate cancer. Methods of using 22P4F11 polynucleotides, polypeptides and antibodies for the diagnosis and treatment of cancers expressing 22P4F11, especially prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27252 encode the human ORFX proteins given in ABP00101 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a

syndrome associated with ORFX-associated disorder. ORFX polynucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosia of liver, psoriaais, benign tumours, keloid, degenerative disorders, haemorrhage, careoarthritis, neurodegenerative disorders, disorders, haemorrhage, cransplantation, cardiovascular diseases, disbetes mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune disorders such as multiple sclerosis, rheumatoid disease and autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from conficient part of the printed specification, but was obtained in electronic form part of the printed specification, but was obtained in electronic cormat directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes an isolated polynucleotide (I) of Alloiococcus otitidis genomic DNA, which encodes an antigenic protein. Alloiococcus otitidis is a Gram-positive bacterium. Also described: (I) an isolated polypeptide that is encoded by the polynucleotide (I); (2) an expression vector comprising the novel isolated polynucleotide (I), its complement, degenerate variant or fragment; (3) a genetically engineered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  leotides and polypeptides, useful for drug screening assays and monitoring of

Claim 1; SEQ ID NO 10066; 122pp; English.

```
host cell, transfected, transformed or infected with the vector of (2);

(4) an antibody specific for the polypeptide of (1); (5) an immunogenic composition comprising the polypeptide, its complement, biological equivalent or fragment, or the polymorlectide that is comprised in the expression vector; (6) a pharmaceutical composition comprising the polypeptides of (1) and a carrier; (7) a protein chip comprising the polypeptides of (1), their biological equivalent or fragment; (8) immunogenic composition; (9) detecting and/or identifying Alloicoccus cutitidis in the biological sample; (10) a kit comprising a container containing the novel polymucleotide, its degenerate variant or fragment, or the antibody of (4); and (11) producing a polypeptide by culturing the polymetically engineered host cell under conditions suitable to produce the polymetical form the culture. (1) can be used in gene therapy. The polymucleotides, antibodies and compositions of the present invention can be used for treating and diagnosing diseases, drug creening assays and monitoring of effects during drug clinical trials. The present sequence represents an Alloicoccus otitidis and the present sequence represents an Alloicoccus otitidis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; heat tolerance; pathogen tolerance; pathogen tolerance; pathogen tolerance; pathogen tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomanna; bacterial polypeptide.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant such as maize or soybean. The method of producing a transformed plant such as maize or soybean. The method of producing a transformed plant cach having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plants with improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme semultions, pathogens or peets, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperporliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;

                                                                                                                                                                         The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1) in the specification). ABN15762 to ABN27525 encode the human ORFX proteins given in ABP00100 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, cateoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular disorders, disbetes mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage diseases, various immune deficiencies and disorders, infectious diseases, autoimmune disorders sullippe sclerosis, rheumatoid arthritis, autoimmune inflammatory eye disease. Open transplantation burne inflammatory eye disease. Open diseases, desting are also set of the set of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; immunosuppressive; nootropic, neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disorder; neurological disease; infection; human; secreted protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from systemic cytokine damage. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to the isolation of genes AAC63410-C63458 encoding the human secreted proteins AAB29802-B29850. This sequence represents a cragment of the protein encoded by the gene given in the descriptor line. The sequence is used as a query sequence for doing BLASTX searches to determine homologous sequence to the protein. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tisques disclosed in the specification. The nucleic acids, proteins, c.g. by protein or gene therapy. The genes are isolated from a range of human tisques disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal crack, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune crickyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, thematoid arthritis and ulcerative colitis; (c) cardiovascular disorders cue as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases cue as viral, bacterial, fungal and parasitic infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                   Isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

in the formation, differentiation and maintenance of multicellular corganismes, remaining the formation, differentiation and maintenance of multicellular corganismes. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information.

Corganismes. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information.

Corganismes. The fate of many individual cells (for example mitogenic factors, such the cells and hormones) which are received and interpreted by diverse cell receptors or membrane bound proteins. These membrane bound proteins and receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins of the invention may have cytostatic activities through the strimulation of chondrocytes. The nucleic acids of the invention may be useful for the manufacture of a medicament for diagnosing or treating a cumman. In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present
                                                                                                                                                This invention relates to novel nucleic acids encoding human PRO secreted
                 New PRO polypeptides, useful for diagnosing and treating an immune related disorder, e.g. systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, thyroiditis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Soybean, protein phosphatase 2A; protein phosphorylation modulation, transgenic plant, gene therapy.

In present sequence to soprom process, the present sequence are coding this protein was identified in clone src2c.pk023.19 of a cDNA library made from soybean eight-day-old root infected with cyst nematode. BLAST analysis showed that the sequence encodes protein phosphatase 2A regulatory subunit B. The nucleotide sequence may be used for the recombinant production of the protein in vivo, e.g. via a gene therapy protocol, or in vitro, e.g. in fermentation culture. The protein may then be used to modulate the process of reversible protein phosphorylation in plants. It may be used directly to supplement a plant's own production of the enzyme or to rectify mutations that result in the expression of inactive protein. The protein may also be used to test for modulators of protein phosphorylation which may be used to alter the activity of the enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                              The present sequence is soybean protein phosphatase 2A regulatory subunit
                                                  Polynucleotides encoding plant protein phosphatase useful for modulating reversible protein phosphorylation in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, vaccination; gene therapy; nutritional supplement; stem cell proliferation; haematopoiesis; nerve tissue regeneration; immune suppression; immune stimulation; anti-inflammatory; leukaemia.

           expressing the proteins are an aregonized for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and calls genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB53300-ABB55521). The nucleic acid sequence, is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese. Note: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-0CT-2001) which is available in electronic format directly from WIPO at
identifying agents (agonists and antagonists) that bind to them. Cells

The invention relates to the isolation of genes AAC59624-C59669 encoding the human secreted proteins AAB14439-B34448. This sequence represents a peptide fragment homologous to the protein encoded by the gene isolated in the present invention. The sequence is a search result from a BLASTX homology search. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and in the specification. The nucleic acids, proteins, antibodies and in the specification. The nucleic acids, proteins, antibodies and in the specification of:

(ant) agonists are useful in the diagnosis, treatment and prevention of:

(a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders end outlements, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid and parestive colitis; (c) cardiovascular disorders such as myccardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, because in the found and parasitic infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

```
New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance;
                                                                                                                                                            cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.
                                                                                                                                                                                                                                                                                                                                                                              Goldman BS;
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 1; SEQ ID NO 16932; 122pp; English.

conjugations and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by practices. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypercosis and osteomyellitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with a cne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The plypeptides may be used as antigens in the production of antibodies percipit for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and cherefore treat P. acnes infections. The antibodies may also be used as antigens. The antibodies may also be used as enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mitcham JL, Wang SS, Bhatia A; Jen S, Carter D;

                                                                                                                                                                                                                                                                       WO200181581-A2.
                                                                                                                                                                                                                                                                                                             01-NOV-2001.
```

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to prowoter functional in a plant cell, where the promoter is positioned to provide for expression of a polymucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant the excombinant DNA construct and growing the transformed plant with the aving an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the comprised or polypeptide is useful for producing plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, improved plant properties, e.g. improved cold, heat or drought tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased resistance to plant disease, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scome part of the printed specification but was obtained in electronic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated polynuclectide (ACF64435-ACF64733)

cenceding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynuclectides (BMM35624-ABM64536) and to immunogenic fragments of by a canes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a continuous comprising a polypeptide of the invention; antibodies against polypeptides of the invention; a method for sthmulating an immune response specific for a P. acnes in composition (comprising P. acnes polypeptides, polypeptides, and an isolated T cell population comprising T cells prepared via this method; a vaccine composition proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit continuous conti

The breast tumour antigen polypeptides of the present invention and their coding sequences are useful for inhibiting the development of breast cancer in a patient. The breast tumour antigen polypeptides and polynucleotides may be used in vaccines and pharmaceutical compositions for treating breast cancer, and for diagnosing and monitoring the cancer. The present sequence is a immunogenic portion for one such human breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Breast tumor antigen polypeptides and polynucleotides, useful for manufacturing vaccines and compositions for treating, diagnosing, and monitoring breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to the isolation of novel lactic acid bacteria (Lactobacillus rhamnosus strain HN001) polynucleotide sequences, and the proteins encoded by them. Also disclosed are oligonucleotide probes and primers, and genetic constructs comprising the polynucleotide sequences of the invention. The polynucleotide sequences are useful for preparing a vaccine against bacterial infections or for improving the properties of microbes used in the manufacture of milk-derived products, food products, food additives, nutritional supplements, bloactive substances or probiotic supplements, and for modifying the flavour, aromatic and intrinsial value of foods. They are also useful for identifying microorganisms having a trait associated with the polynucleotide. The present sequence represents a novel L. rhamnosus polynucleotide sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at segdata.uspto.gov.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotide from Lactobacillus rhamnosus HN001 strain, useful for preparing a vaccine against bacterial infections or for modifying the flavor, aroma or nutritional benefits of a bioactive or probiotic supplement product.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to detecmine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by
Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antiinflammatory; infection; vaccine; meningitis; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Fraser C;

AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAX34381 to AAX34583. AAX91802 to AAX91899 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivalis. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                             Porphorymonas gingivalis; PG; periodontal disease; gingivitis; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antigenic Porphorymonas gingivalis peptides for preventing gingivitis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5481 sequences (51), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN6604-ABN71526 and activity. (I), nucleic acids encoding (I), ABN6604-ABN71526 and the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a streptococcus mapped (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity characteristy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAY34583. AAX91802 to AAX91989 represent PCR primers used in the AAY34583. AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                        Antigenic Porphorymonas gingivalis peptides for preventing gingivitis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for preparing a vaccine composition against Klebsiella pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Porphorymonas gingivalis; PG; periodontal disease; gingivitis; vaccine;

This invention describes novel isolated Streptococcus pneumoniae polymucleotides (see AAZ96173-256494) and their encoded proteins (see AAX95792-Y86182). The DNA, vectors and host cells described in the method of the invention are useful for the recombinant expression of the polypeptides. The polypeptides are useful for treatment or prevention of disease, or diagnosis of disease related to expression or activity of such a polypeptide. They can also be used to expression or activity of interact with and inhibit or activate such a polypeptide. The polypeptide for DNA encoding them, via agene therapy) are also useful for inhibit such bacterial polypeptides. The polypeptides to inhibit such bacterial polypeptides. The polypeptides are particularly useful to identify antimicrobial compounds and antibiotics. They are also useful to determine their role in pathogenesis of infection, dysfunction and disease
                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
Streptococcus pneumoniae proteins and related DNA - useful for screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a recombinant DNA construct comprising a promoter functional in plants operably linked to an oil-associated gene. The construct is useful for transgenic plant seed which has in its genome the construct, that is functional in the plant to transcribe the oil-associated gene. The transgenic plant seed grows into a plant having enhanced seed oil as compared to wild type. The construct is useful for producing hybrid maize seed. The transgenic plant seed is useful for producing vegetable oil. The present sequence represents the amino acid sequence of an oil-associated gene related protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel recombinant DNA construct comprising a promoter functional in plants operably linked to an oil-associated gene for producing transgenic
discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The sequence is that of the polypeptide encoded by a region isolated from S. pneumoniae which shows homology to serine protease HtrA. The protein, or agonists of it, may be useful as an antibacterial for treatment or prevention of infection, specifically caused by S. pneumoniae (particularly meningitis) but possibly also Helicobacter pylori (ulcers and gastric cancer). It may be of particular use before insertion of an in-dwelling device or any other invasive procedure. The protein, or nucleic acid encoding it, can also be used in vaccines to induce a cellular and/or humoral immune response, or to screen for other antibacterials. The DNA may also contain flanking sequences that are potential sources of control elements for bacterial gene expression. Detecting a sequence encoding the protein can be used diagnostically, e.g. to detect a mutation for serotyping or classifying infectious agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Soybean, protein phosphatase 2A, protein phosphorylation modulation, transgenic plant, gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a recombinant DNA construct comprising a promoter functional in plants operably linked to an oil-associated gene. The construct is useful for transgenic plant seed which has in its genome the construct, that is functional in the plant to transcribe the oil-associated gene. The transgenic plant seed grows into a plant having enhanced seed oil as compared to wild type. The construct is useful for producing hybrid maize seed. The transgenic plant seed is useful for producing vegetable oil. The present sequence represents the amino acid sequence of an oil-associated gene related protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel recombinant DNA construct comprising a promoter functional in plants operably linked to an oil-associated gene for producing transgenic

                                                                                                                                                                                                            B. The nucleotide sequence encoding this protein was identified in clone src2c.pk023.19:fis of a cDNA library made from soybean eight-day-old root infected with cyst nematode. BLAST analysis showed that the sequence encodes protein phosphatase 2A regulatory subunit B. The nucleotide sequence may be used for the recombinant production of the protein in vivo, e.g. via a gene therapy protocol, or in vitro, e.g. in fermentation culture. The protein may then be used to modulate the protein in supplement a plant's own production of the enzyme or to rectify mutations that result in the expression of inactive protein. The protein may also be used to test for modulators of protein may also be used to test for modulators of protein phosphorylation may then may also be used to test for modulators of protein phosphorylation which may be used to alter the activity of the enzyme
                                                                                                                                                                                                     The present sequence is soybean protein phosphatase 2A regulatory subunit
                                                                                                                                             Polynucleotides encoding plant protein phosphatase useful for modulating reversible protein phosphorylation in plants.

                                                                                                                                                                                                                                                                                              The DegP (HtrA) protease (the present sequence) is a multifunctional protein essential for the removal of misfolded and aggregated proteins in the periplasm. DegP is essential for virulence in several Gram negative pathogens. The present invention relates to an assay for identifying inhibitors of DegP. The assay comprises mixing suspected DegP inhibitors whith DegP and a suitable substrate, preferably the major piln subunit of Pap pilus, and detecting changes in DegP activity. The compounds identified as inhibitors of DegP protease function are useful as
Assay for DegP protease inhibitors useful as therapeutic agents, involves mixing inhibitor of DegP activity with DegP and major pilin subunit of Pap pilus as substrate and detecting changes in DegP activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

The invention relates to a method of identifying compounds that modulate a newly identified mar regulated (IMTR) polypeptide activity. The method comprises contacting an NIMR polypeptide with a test compound under interaction conditions, determining the ability of the compound to modulate the activity or expression of the polypeptide, and selecting the midliators. NIMR mucleic acids and polypeptides are used in the treatment of microbial infections, and in screening for modulators of NIMR expression and activity. These modulators can be used to reduce the infection infection a surface, and the virulence of a microbe in a subject suffering from an infection. AAU29129-AAU291379 represent Escherichia coli NIMR amino acid sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bscherichia coli, major nitroreductase protein, NfsA, Vibrio harveyi, NADH oxidoreductase Frp; flavin reductase P; enzyme; antibacterial; antituberculostatic, vulnerary; antiinflammatory; virucide; auditory; antitubsive; litholytic; nephrotropic; gastrointestinal; antilocer; bacterial growth inhibitor; bacterial infection; microbial infection; tuberculosis; respiratory infection; prondhitis; sinualtis; pneumonia; sore throat; diphtheria; acute epiglottitis; influenza; ottis media; bronchopneumonia; Legionnaire's disease; whooping cough; urethritis; cystitis; pyelonephritis; colitis; enteritis; gastric ulcer; cholera;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying compounds that modulate a newly identified mar regulated polypeptide activity, useful as antimicrobial compounds, involves contacting the polypeptide with a test compound.
                                                                                                       mar regulated polypeptide; NIMR; microbial infection; antibacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   major nitroreductase protein NfsA amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            81.8%; Score 18; DB 4; Length 240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the amino acid sequence of the nitroreductase enzyme ncoded by the E.coli nfsA gene. The gene was isolated as given in Kumar and Jayaraman, (1991) J.Bioscence, 16, 145-159, and was subcloned to produc the plasmid pAJ102. The gene can be used to generate strains of E.coli which are senstive to mutagenic and carcinogenic substances
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 E. coli nitro:reductase gene - useful to produce mutagen or carcinogen sensitive strain, using E. coli host.

                                                                                                                                                                                                                                                                                                heterocyclic compounds (I) to their salts. (I) has antibacterial, antituberculostatic, vulnerary, antiinflammatory, virucide, auditory, antituberculostatic, nephrotropic, gastrointestinal and antiulcer activities, and can be used as a bacterial growth inhibitor. (I) can be used for treating bacterial or microbial infection and tuberculosis in wound cleaning methods (e.g. wipes or gavage); for treating upper and in wound cleaning methods (e.g. wipes or gavage); for treating upper and lower respiratory tract infections (e.g. bronchitis, sinualis, consented plates). The consented is a similar, chronic streptococcal infections dipthheria, acute epiglotitis, influenza, chronic bronchitis, middle ear infections (ctitis media) bronchopneumonia, regionnaire's disease, atypical pneumonia or whooping cough), urinary tract infections (e.g. urethritis, cystitis, pyelonephritis (kidney infection), asymptomatic bacterial cystitis, acute urethral syndrome or recurrent urinary tract infections or infections (e.g. tood consenting), asymptomatic bacterial uresticis, pastrointestinal infections, cholera or typhus). (I) can be used for inhibiting bacterial growth in a non-living system. The present sequence represente an E. coli major nitroreductase protein NfaA which is given in comparison with a NADH oxidoreductase protein NfaA which is communishing acute inventive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomybilitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies polypeptides may acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by curryen linked immunosorbent assay (ELISA). Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                  SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay;
                                                                                                                                                                                                                                                                                                                                                                                                                   Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Propionibacterium acnes predicted ORF-encoded polypeptide #28230.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAY34363. AAX91802 to AAX91999 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                             Porphorymonas gingivalis; PG; periodontal disease; gingivitis; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Patterson MA, Agius CT, Rothel LJ, Margetts MB;

AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAX34883. AAX91802 to AAX91898 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                          Porphorymonas gingivalis; PG; periodontal disease; gingivitis; vaccine;
